

- Retain certain applications on-premises while migrating others to the cloud with a plan to revisit them later for further decision-making.
- Also referred as revisit, reassess or co-locate to a service provider.

- Allows for evaluation of (recently upgraded) applications in order to identify those that require immediate migration or those that could be migrated in the future.
- Saves cloud resources by retaining inefficiencies on-premises.

- The longer you keep the workload on-premises, the more resources you may waste supporting it.
- Maintaining the status quo may mean not exploring more efficient, secure, cost-effective, and productive practices in a new environment.

- Lack of cloud-native capabilities, meaning no automated scaling or improved performance.
- Requires costly and continuous maintenance of the on-premises hardware.
